

Ausgrid's SSCR is the product of an extensive process of consultation and development.

CCA's involvement in the SSCR project started with ergonomic training for the end-users, stakeholders and the fitout consultant teams.

Through the training and design workshops, CCA engaged the various stakeholders and guided the design and construction team through the guidelines and principles of *ISO11064 The ergonomic design of control centres*.

# The ergonomic design of the Ausgrid Sydney System Control Room...

“The process was user-centric and CCA was able to help document the users' requirements and worked with the design and construction team to navigate the possibilities and constraints. We are very proud and happy with the Control Centre that we built, and truly believe that the facility will continue to serve us into the future.”
